

WiZ SPACESENSE™ ENABLES LIGHTS TO ACT AS MOTION SENSORS

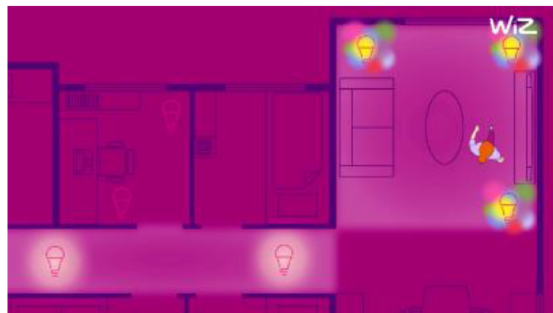

SpaceSense™ is the industry-first motion sensing technology developed by WiZ and is exclusive to the WiZ system.

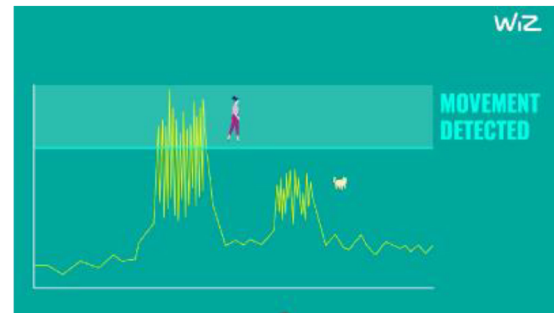

- It uses Wi-Fi signals that are already present in the room to detect motion.
- The detection is omnidirectional. Unlike in the case for a traditional motion sensor, it doesn't require line of sight during installation.
- No dedicated sensor or battery is required. All you need is to install at least two SpaceSense compatible lights in a room and connect them with the WiZ app.

Wi-Fi signals are slightly disturbed when people move around in a room, like a ripple in a swimming pool.

By measuring the deviations in signal strength caused by those disturbances, WiZ lights can determine if there is movement in the room.

The sensitivity of the system can be adjusted, for example, to prevent your pets from triggering it while running in and out.
